# **MAINE PEGMATITE MINES AND PROSPECTS**

## **and**

# **ASSOCIATED MINERALS**

### **Introduction**

This publication is the first of a series which is designed essentially to provide basic information on the locations of mineral occurrences in Maine which may be of commercial importance or popular interest. Contained in this publication is a compilation of some 184 pegmatite mines and prospects, their locations, associated minerals and persons to contact for further information or for permission to visit. The compilation is not represented to be complete, and is offered primarily as a preliminary guide-book which may aid mineral collectors and commercial mining organizations in appraising Maine's wealth in feldspar deposits and their associated industrial and exotic minerals.

The pegmatites of Maine are essentially coarse-grained concentrations of feldspars and quartz which occur as pod-shaped or sheet-like bodies ranging from a few inches to over 4,000' in length. They have been mined for over 100 years for potash feldspar, with occasional supplementary production of quartz, sheet mica, beryl, spodumene, and other industrial minerals. They are famous throughout the world as sources of semi-precious gem minerals including varieties of tourmaline, beryl, topaz, and rose quartz. Hundreds of mineral collectors scratch over waste-rock dumps every summer searching for material to add to their collections or to make into jewelry. This publication should serve collectors well, to help them to locate the more publicized collecting grounds, and to provide them with names of owners or others who should be able to help them in their efforts.

It is important to point out, however, that pegmatites are of much greater value economically than merely as sources of interesting minerals for collections. To date, something over one million tons of potash feldspar has been shipped from the pegmatites of Maine for use in ceramic products, pottery, abrasives, and cleaning compounds. With the development of efficient mining methods and mineral concentrating techniques, Maine pegmatites have become a valuable source of low-cost feldspar which should enjoy a profitable position in the national market.

### **Acknowledgments**

The information presented in this publication has been collected by study of existing literature and by field examination. Most of the information contained herein was collected during the summer of 1956 by Dabney W. Caldwell, Department of Geology, Wellesley College, Wellesley, Massachusetts, and compiled for publication by Mrs. Muriel B. Austin, Department of Geology, Colby College, Waterville, Maine. A small percentage of the mines listed were added by the State Geologist during the pre-publication field check. Many interested persons have contributed information freely for the benefit of all. The Maine Geological Survey appreciates especially the fine cooperation and assistance extended by Howard M. Irish and Charles F. Marble of Buckfield and Stanley I. Perham of West Paris.

### **Explanatory Considerations**

Although this publication represents the most complete compilation to date on pegmatite mines and prospects, there are undoubtedly many properties and associated minerals which have been missed because of the limited time available in which to make the collection. In some instances, locations marked on the maps in the back of the book may be correct only within one-half mile or so. The outlined area on Plate CB in Phippsburg was mapped in detail by the United States Geological Survey during World War II, and may serve as an example of the high frequency of pegmatite occurrences throughout the pegmatite belt which extends from Boothbay to Rangeley in the Southwestern part of Maine.

The minerals which are listed here for the various properties represent only those minerals to which literature or personal references were readily available at the time the compilation was made. It is hoped that as time passes, collectors and other interested persons will submit new or additional data to the Maine Geological Survey so that subsequent revisions of this publication may be of increasing value and accuracy. A ruled page is provided at the end of the mine localities list for filing additional information which may be acquired on collecting trips or commercial investigations. It is important to note that most of the properties listed are privately owned, and many are in active operation during the summer months. In order to observe the rights of the landowner, and to avoid possible injury from dynamiting or other production activities, an interested visitor should always acquire permission before entering upon any property listed herein.

### **Selected Bibliography**

Pegmatite Investigations, 1942-45, New England. United States Geological Survey Professional Paper 255, by E. N. Cameron and others. 1954. 352 pp., 48 pls., 139 figs.

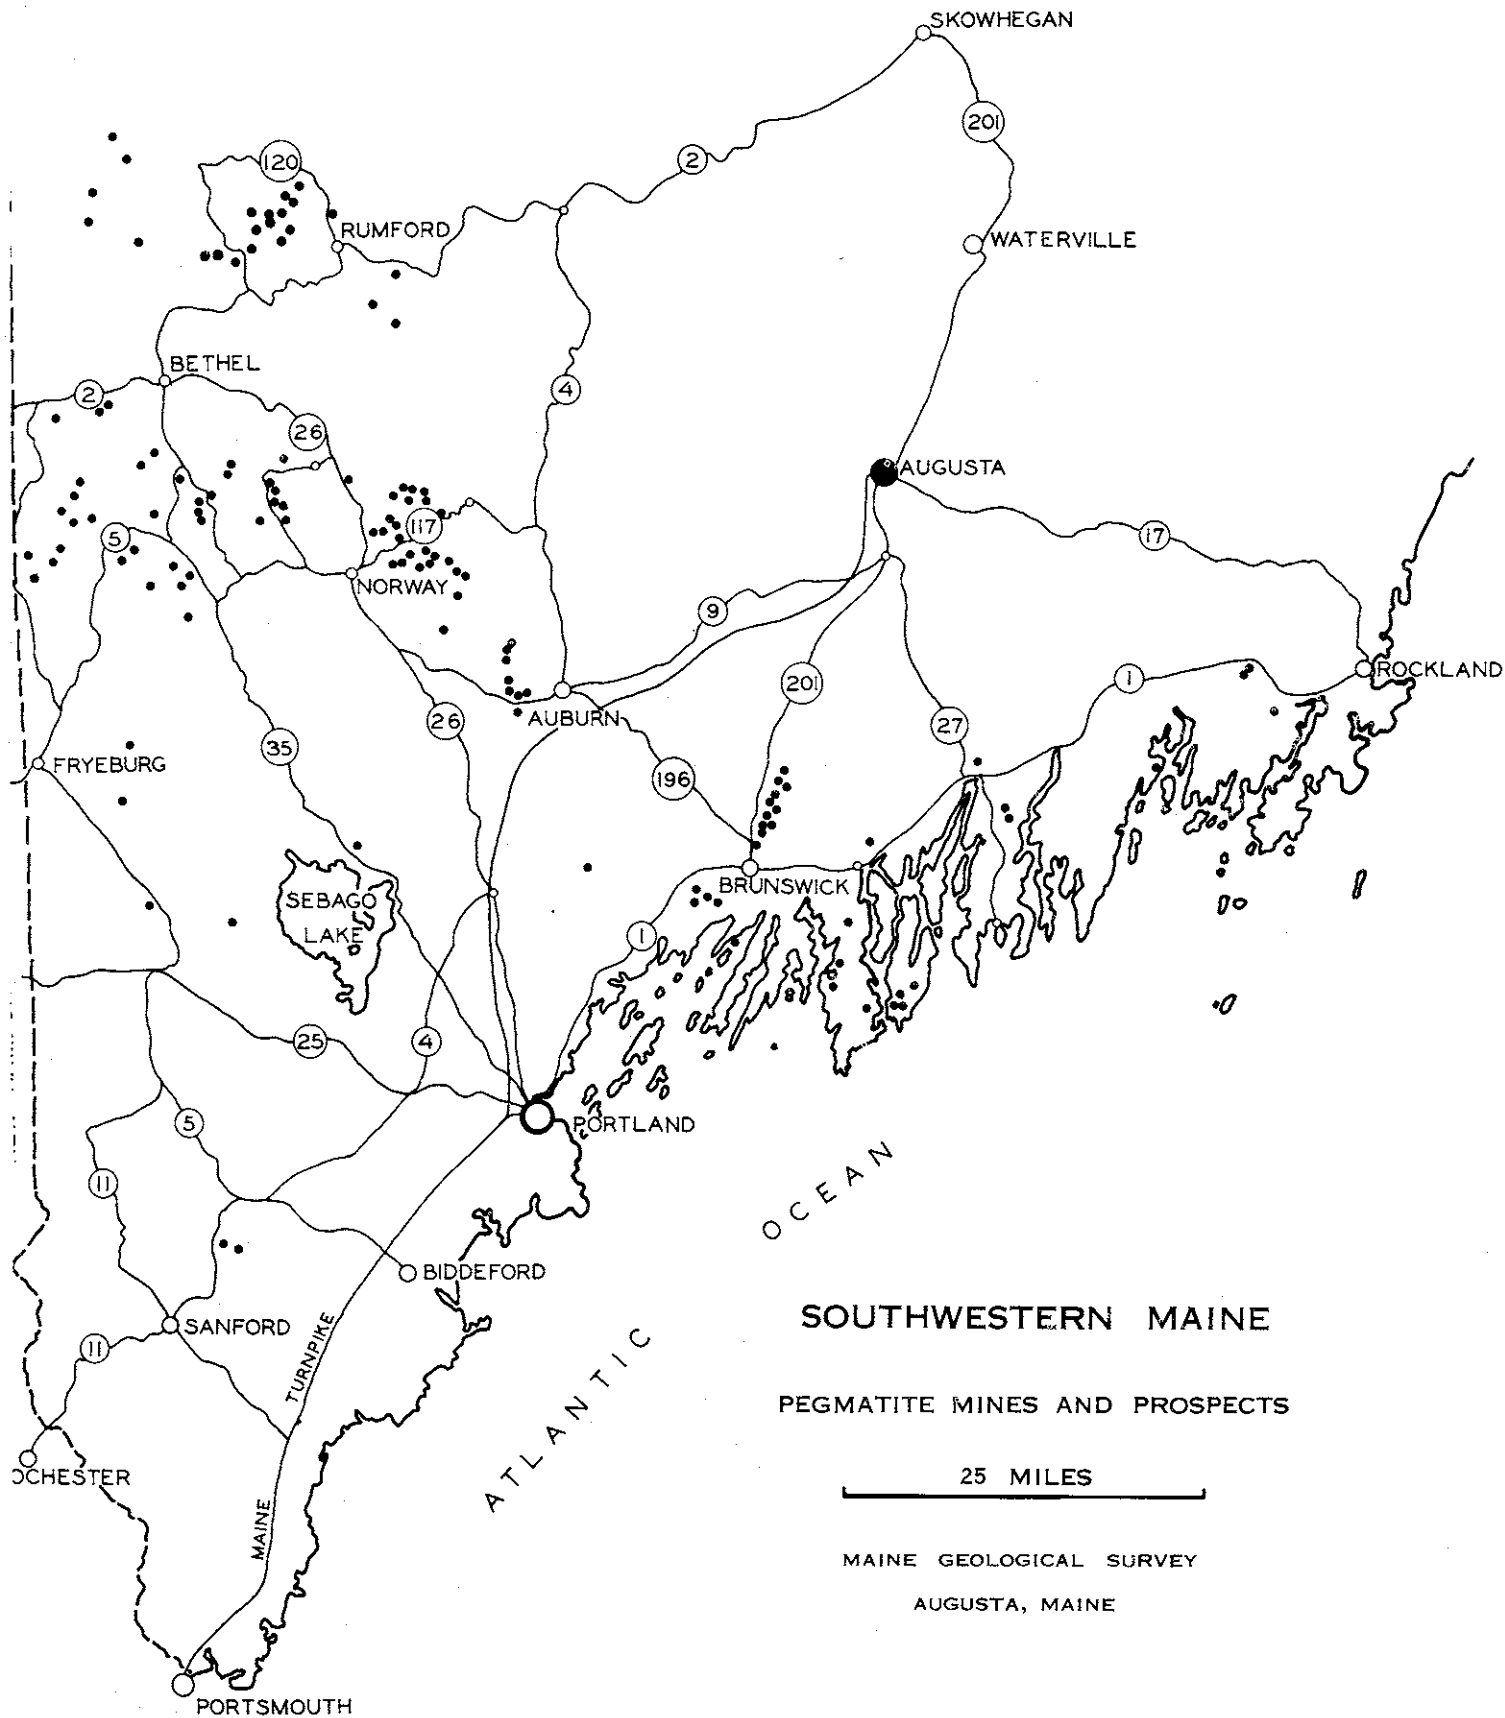

Geology of the pegmatites and associated rocks of Maine, including feldspar, quartz, mica, and gem deposits. United States Geological Survey Bulletin 445, by E. S. Bastin. 1911. 152 pp., 19 pls.

Economic geology of some pegmatites in Topsham, Maine. Maine Geological Survey Bulletin 5, by V. E. Shainin. 1948. 32 pp., 9 figs.

Pegmatites and associated rocks in the Newry Hill area, Oxford County, Maine. Maine Geological Survey Bulletin 6, by V. E. Shainin and L. F. Dellwig. 1955. 58 pp., 11 figs., 2 pls.

Handbook for a Week with Maine Minerals, by Neil A. Wintringham. Holiday Hill Press, 1485 Force Drive, Mountainside, New Jersey. 1955. 2nd ed., 176 pp., maps and figs.

Maine Mines and Mineral Locations, by Philip Morrill. Dillingham Natural History Museum, Naples, Maine. 1956. 47 pp., 12 maps.
